## Preamble

174

175

176 Pig rearing is one of the most important occupations of rural society  
177 especially among the tribal masses of India. It has largely remained under nomadic  
178 system of rearing with the weaker sections of the society both as a source of income  
179 and a choice of meat for consumption. Cost of inputs and returns are not a serious  
180 concern in this low or zero input pig rearing system. Pig is one of the most efficient  
181 food converting animals among domesticated livestock and can play an important  
182 role in improving the socio-economic status of the weaker sections of the society,  
183 particularly in the North-Eastern Region of the country. Bulk of the pig population  
184 in India is indigenous type with low growth rate and productivity. The share of pork  
185 to the total meat production has been almost static for last 15 years at about 10%.  
186 Average meat yield of pigs in India is about 40kg/animal, which is about 55% less  
187 than the corresponding value of world average. Over 70% of the pigs kept in India  
188 are crossed with exotic breeds, but with a large amount of inbreeding because of  
189 non-systematic breeding and selection. The bulk of the pig population remains  
190 indigenous with low growth rate and productivity. In nutshell, the pig rearing is still  
191 unorganized venture that requires science and technology driven support to make it  
192 a vibrant enterprise. The various stakeholders require promotion at various levels  
193 such as technology, entrepreneurship development, and financial support to drive a  
194 mark for Indian pig farming a place at global level. Further the shrinking resources  
195 in terms of land availability, water as well as threats from the changing environment  
196 being conducive for emergence of new diseases are gradually expected to limit the  
197 capacity for pork production optimization. If the country does not take suitable step  
198 now to develop and execute scientific strategies to address the issues of bridging the  
199 gap between need and availability of pork, other countries, taking the advantage of  
200 globalisation, shall make inroads to a sector that is so inextricably linked with the  
201 economic condition of rural poor in the country. It is assessed that the pig farming  
202 has immense potential to ensure nutritional and economic security for the weaker  
203 sections of the society. Hence, a road map in the form of Vision 2050 is prepared,  
204 keeping in long terms interests to provide sustainable and inclusive growth and  
205 ensure nutritional security through technology driven pig rearing in the coming four  
206 decades time.

## Scenario of Piggery sector

240

241 Pig production, among other species has a high potential to contribute to high  
 242 economic gain. This is because of two folds: First the pigs have high fecundity, high  
 243 feed conversion efficiency, early maturing, short generation interval and relatively  
 244 small space requirement. Secondly, they are multipurpose animals providing about  
 245 40% of meat in the world market, and by-products like pig dung as manure and  
 246 bristle for brush industry. It is produced under a variety of production systems  
 247 ranging from simple backyard pigs, pigs living on garbage belts to family operated  
 248 farms or large scale integrated pig industries with sophisticated bio-safety measures.

### 249 Pig population in India

250 Pig is widely distributed in all the eco-regions of the country and is an  
 251 important occupation of the rural society especially the tribal masses. People of  
 252 certain ethnic groups prefer to keep pigs, especially black ones, for festivals and  
 253 ceremonial purposes. Pigs are concentrated in the North-Eastern Region where  
 254 almost 40% of the country's total pig population exists. As per the latest livestock  
 255 census, the pig population is 11.13 million and is presently showing a decline trend  
 256 (BAHS, 2012). The pigs constitute 1.47% of world pig population and our piggery  
 257 sector is gaining slow but steady momentum during the past years. Majority of our  
 258 pig population is held by marginal and small farmers. Further, the average pig  
 259 population per thousand human populations is about 11.5. Among Indian states,  
 260 Uttar Pradesh has the maximum number of pigs with about 17% of the total pigs  
 261 followed by Assam (~12%), West Bengal (~10%) and Jharkhand (~8%). The  
 262 distribution of land and pig holdings in India is presented in table 2.

263 **Table 1: Pig and pork production in India and world (2009)**

Item	Production		India's share (%)	Decadal Growth rate (1999-2009)	
	India	World		India	World
Pig (million)	13.84	941.78	1.47	3.40	5.00
Pork (MT)	0.48	106.33	0.45	3.40	15.45

265 **Table 2: Distribution of land and pig holdings in India**

Landless (<0.002 ha)	Marginal (0.002–1.0 ha)	Small (1.0–2.0 ha)	Medium (2.0–4.0 ha)	Large (>4.0 ha)	overall
Distribution of pig population (%)					
7.7	49.9	20.4	13.9	8.1	100
Size of pig holdings (no/100 households)					
1	4	6	6	6	4

266 Source: Govt. of India, National Sample Survey Organization. Land and livestock holdings.

267 The pork production in India is growing steadily in a slow pace and the share  
268 of pork in total meat production of the country remained static over a decade.

269  
270 According to ICMR recommendation, out of 60 gm daily protein requirement; 20gm  
271 should be from animal protein source. Considering a modest figure of 20% of total  
272 population consuming pork in the country today, and out of 20gm daily animal  
273 protein, assuming 10 gm from pork source; the total pork requirement is around  
274 0.88 million ton (20% of 1210 million human population *i.e.*  $242 \times 0.010 \text{ kg} \times 365$   
275 days). Against this, the country as per FAOSTAT figure (2009), produced 0.48  
276 million ton of pork. Thus the present shortfall is 0.40 million ton or 45.45%. If the  
277 deficiency is not met through appropriate technological interventions, the gap is to  
278 be widened to such an extent that the country might be forced to import pork in  
279 days to come to meet the demand.

280

### 281 **SWOT analysis of piggery sector:**

#### 282 **Strength**

283 13.11 million (2011) pigs is strength to meet the animal protein deficiency  
284 experienced in the country. Ability of the pig to survive and produce under adverse  
285 husbandry practices is strength particularly for the weaker, tribal and landless  
286 population of the country. Increased demand for pork and pork products like  
287 sausage, bacon etc. is the strength for economic upliftment of the pig growers. Pig  
288 by-products, namely bristle and inedible offal are strength to support allied  
289 industries. Both commercialization and organic pork production are considered  
290 strengths to give a meat revolution to the country and thereby provide employment  
291 to a large section of the rural poor.

292 India still has around 250 million people below poverty line who go to bed  
293 hungry. Most of this population is again in the tribal belts of the country where the  
294 people are non-vegetarian in their dietary habit. Pork consumption being popular  
295 among these populations, improved pig husbandry programmes has been observed  
296 to be an important area in the poverty alleviation programme of the Government.

#### 297 **Weakness**

298 Absence of sufficient number of breeder farmers throughout the country is a  
299 weakness for which sufficient numbers of quality pigs are not available for the  
300 fatterer farmers as well as to the markets. Religious taboo attached with pork  
301 consumption is also a weakness for which marketing of pork has to be confined to a  
302 selective group. Tendency of the pig grower to raise pig to marketable age on zero to  
303 negligible inputs is another weakness. Preference of the consumers for pork from the  
304 local pig is another weakness for promotion of improved pig with lean meat quality.  
305 Lack of adequate support from the development and financial bodies to establish  
306 pork based industries is hindering the growth of pig to the desired extent. In the  
307 absence of supportive industries in and around the areas where pigs are grown, by-  
308 product utilization suffers a setback for which economic return is less.

#### 309 **Opportunities**

310 Pigs being a live source of insurance particularly for the weaker section of the  
311 community, there is a tremendous opportunities to use pig as a medium of poverty  
312 reduction in the country.

313 Since region like North East in the country where around 50% of country's  
314 pork is consumed by way of procuring live pigs from other parts to the tune of  
315 around 1.0 lakh pig heads per annum, a very good opportunity exists for opening up  
316 employment generation for rural youth in this sector. Self employment to at least 200  
317 youths in the region would be ensured giving a target of production of 500 weaner  
318 pigs by each one of them per annum to produce marketable pigs of 1.00 lakh  
319 number. Each one of them could in turn, employ at least 10 pig-man to support the  
320 production i.e.  $10 \times 200 = 2000$  numbers of unskilled persons employment. In  
321 addition to this, weaner pig purchasers (fattener farmer) get benefited through the  
322 enhanced income from the improved pigs they receive from the piglet producers.  
323 Self employment to another set of pork product processor and workers is yet another  
324 opportunities through pig husbandry not to mention about Self Help group (SHG)  
325 personnel to be engaged in service delivery like A.I, Vaccination *etc.*

326 Since pig is a prolific breeder, achieving the targeted growth of 10% in meat  
327 sector is another opportunity through pigs.

328 Considering a figure of about 5 million adult pigs are slaughtered per year  
329 and each pig yielding 250grams of fiber, the quantity of fiber availability will be to  
330 the tune of 1.25 million tones. At the current market rate (as surveyed in December,  
331 2012) of around Rs800/kg of fiber, the total value of produce) will be Rs100crore.  
332 Since, in the North Eastern region of the country alone, where around 50% of  
333 country's pork is consumed by way of procuring live pigs from other parts to the  
334 tune of around 1.0 lakh pig heads per annum and immense opportunity exists for  
335 employment generation for rural youth in the piggery sector. The awareness and  
336 growth of end users is an opportunity for the development of fiber based brush  
337 making industries.

338

### 339 **Threats**

340 High cost and more than 60% deficiency in concentrate feed sources are threat  
341 to the pig industry which compete human for grains. Non availability of sewage  
342 disposal and by product utilization facility particularly in areas where pig  
343 concentration and slaughter is maximum is another threat from public health point  
344 of view for which general public might offer negative views for the growth of pig  
345 industry.

352

353

354

355

356

357

358

359

360

361

National Research Centre on Pig was established by the Indian Council of Agricultural Research on the recommendation of mid-term appraisal committee constituted by ICAR in 1990 after reviewing the work of the All India Coordinated Research Project (AICRP) on Pig. The institute was established in Guwahati, Assam located in North-eastern part of India where 40% of country's pig population is distributed. Following the clearance for the site and also the approval of the EFC, a plot of land measuring 17 acres was taken over in the year 2002. The foundation stone of the Institute was laid by the then Director General of ICAR, Dr. Panjab Singh on 4<sup>th</sup> September 2002. The pig farm of the Institute has been started functioning since August, 2007 and currently maintaining two exotic (Hampshire and Duroc), two indigenous (Ghungroo and Niang- Megha) pig breeds and their crosses. The office cum Laboratory building was inaugurated on 20<sup>th</sup> May 2008 by Dr.Mangala Rai, then Director General of ICAR.

362

**The institute has the following mandates**

363

364

## **Mandates**

365

366

367

368

369

370

371

- To undertake basic, strategic and applied research in the areas of pig production and health including product/by-product processing, value addition through quality control measures and transfer of the evolved technologies to the client groups.
- To act as a repository of information on pig production and health for regional, national and global policy planning and implementation.

372

373

374

375

376

377

378

379

380

Presently the institute is engaged in basic, applied and strategic research on pigs besides driving towards overall development in the piggery sector of the country. In addition, the institute coordinates 10 All India Coordinated Research Projects on Pig (AICRP on Pig), 4 Mega Seed Projects on Pig spread across the country and has administrative control over a Krishi Vigyan Kendra (KVK) located in the Goalpara district of Assam, with separate mandates and activities converging with the objective of developing and transfer of technologies for promoting sustainable agriculture and animal husbandry.

## NRC on Pig 2050

435

436

437 The National Research Centre on Pig is committed to bring in excellence in all the  
438 frontier areas of research on pig production, health and product development and  
439 productivity enhancement to increase socio-economic status of the pig rearers of the  
440 country through the medium of pig rearing. The NRC stands up to play pivotal role  
441 in addressing the national goals, policy development and international commitments  
442 of the country to improve nutritional security, productivity, profitability, human  
443 resource development, animal welfare and promote sustainable and environment  
444 friendly piggery subsector. The institute will strive hard with the focused efforts to  
445 place a strong mark of Indian pig in the global map.

446

### 447 **Vision**

448 To bring in excellence in pig production, health and product processing  
449 through innovative research in order to provide technology backstopping for  
450 enhanced pork production, employment generation and poverty reduction among  
451 socially and economically weaker sections through the medium of pig husbandry.

### 452 **Mission**

453 Performance appraisal and genetic cataloguing of indigenous pigs,  
454 development of improved pig variety together with production, health, product  
455 processing and pig based integrated farming system technologies to facilitate the pig  
456 rearers of the country achieving household food, nutritional and economic security.

457

### 458 **Focus**

459 The institute will focus through various programmes to achieve vision envisaged  
460 though well structured research, teaching and extension programmes.

- 461 • Genetic improvement of indigenous pigs through selective and crossbreeding  
462 including identification of new traits, genome wide association studies and  
463 finally genomic selection
- 464 • Improvement of physiological and reproductive efficiency of pig production
- 465 • Address the issues related to feed shortage and improvement of nutrient  
466 utilization for enhancing pig production
- 467 • Development of pig health management protocols
- 468 • Post harvest management and value addition of pork
- 469 • Promote environment friendly and climate resilient pig farming
- 470 • Institute-stakeholder linkage and skill developments for improved pig seed  
471 production at various levels of pig production.

- 472       • Develop a database for strategic planning and policy support at national and  
473       international level including development of networks.
- 474       • Programs to induce and sustain economic transition and nutritional security  
475       among the pig rearers through development of novel products and  
476       technologies, their transfer and refinement

477

478

479

480

481

482

483

484

494

## Harnessing Science

495

496

497

498

499

500

501

502

503

504

505

506

507

Pig rearing is one of the most important occupations of rural society especially the tribal masses of India. The pig is one of the most efficient food converting animals among domesticated livestock, and can play an important role in improving the socio-economic status of the weaker sections of the society, particularly in the North-Eastern Region (NER) of the country, which has a significant pig population (about 40%). Considering the relevance of the pig for the NE region, ICAR/Government of India approved the establishment of a National Research Centre (NRC) on Pig at Guwahati, Assam for conducting basic, applied and strategic research and boosting the pig husbandry in the region with a mandate over the entire country.

508

509

510

511

512

513

There is an imperative need to grow more food animals in the region and pig may be considered as the animal of choice due to its high prolificacy, early attainment of slaughter/ market weight, efficient feed conversion rate, relatively less susceptibility to diseases and preference of the local population to pork and pork products. Though the consumption of pork is the highest in the NER, the production and processing scenario of meat in the region is underdeveloped.

514

515

516

517

518

519

520

521

522

523

524

525

The major problem faced by small holder pig farmers in the country is the lack of critical inputs to transform the existing low or zero input system to a vibrant technology driven successful enterprise. It was realized that a small scale economic technology intervention in the form of superior germplasm and package of practices is required to improve income and viability of the enterprise. The institute conducted a survey based project for documenting various pig husbandry practices (procurement of animals, management, housing and health care) for the eight NE states and later on the pork production and quality scenario in the Assam to have first hand information. Based on the surveys, research conducted and anticipated requirements for technology driven piggery development in coming four decades, the Vision 2050 and Expenditure Finance Committee memorandum s for 12<sup>th</sup> five year plan documents are prepared.

526

527

528

529

530

531

532

533

### **Enhancing production through cutting edge research in physiology, reproduction, nutrition, health, genetics and breeding**

One of the key factors in determining the productivity of the pigs is its genetic makeup. Therefore, for production of superior germplasm one of the strategies will be to undertake genetic improvement of indigenous pigs through conventional and molecular methods, keeping in line with advancement of science. The superior germplasm developed will require necessary support in terms of nutrition,

534 physiological, health and farm management research. The various components of  
535 the production enhancement strategy will include:

- 536 • Characterization, evaluation and conservation of indigenous pigs. The  
537 institute presently maintains two indigenous breeds of pigs (Niang-Megha  
538 and Ghungroo) and three exotic breeds (Hampshire, Large white Yorkshire  
539 and Duroc) of pigs. Niang-Megha and Gunghroo has been recognized as  
540 separate breed of pigs and efforts for documentation of other indigenous  
541 germplasm available in India needs to be taken up.
- 542 • Development of suitable cross breed of pig (such as Ghungroo x Hampshire)  
543 and fixation of optimal level of exotic inheritance for maximizing  
544 performance (production, reproduction and carcass characteristics) and  
545 adaptation under farm and field conditions.
- 546 • Development and expansion of database on pedigree and performance data  
547 for taking up genome wide association studies using bioinformatic tools.
- 548 • Molecular screening of indigenous pigs for presence of adverse characteristics  
549 such as Pale, Soft and Exudative (PSE) meat in the pig herds.
- 550 • Application of techniques such genomics, proteomics, gene mining for  
551 generation of basic functional genomic data and identification of various trait  
552 associations.
- 553 • Identification of candidate markers for selected productive and reproductive  
554 traits genomic selection.

555

#### 556 **Physiological and Reproductive management**

557

- 558 • The institute has developed artificial inseminations (AI) protocol along with a  
559 suitable semen extender and so far about 13000 AI born piglets were  
560 produced including 8700 piglets in farmers' house and 4500 piglets in  
561 institutional farm. The efforts for further spread of AI to continue at field level  
562 in collaboration with various stake holders for rapid multiplication of  
563 superior swine germplasm.
- 564 • Optimization of milk production in sows to support increased litter number  
565 including enhancement of mammary gland immunity.
- 566 • Understanding hormonal and nutritional regulation of fatty acid synthesis  
567 and desaturation in pigs for improving fatty acid composition manipulation  
568 and alteration of body fat content.
- 569 • Physiogenomics, functional genomics and systems biology research including  
570 nutrient/hormone-gene interaction analysis.
- 571 • Development of good management practices including promotion of pig  
572 based integrated farming system
- 573 • Development of comfort housing for pigs, keeping in view of impending  
574 climate change.
- 575 • Research on environment friendly pig farming including documentation of  
576 gas emissions, reduction of carbon foot prints and climate resilient agriculture  
577 to ensure long term human and animal welfare.

578

579 **Feeding management for improving quality, quantity and bioavailability of**  
580 **nutrients**

581

582 • Nutritional analysis of locally available unconventional feed resources  
583 including research on impact of industrialization, environmental pollutants in  
584 quality and quantity of feed.

585 • Development of balanced ration for various categories of pigs using locally  
586 available feed resources to reduce feed cost. This includes identification of  
587 novel feed resources.

588 • Formulation of economic rations for application in the field conditions and  
589 resource based feeding

590 • Development of rapid feed evaluation techniques including in vitro methods,  
591 amelioration for anti-nutritional factors, identification and manipulation of  
592 gut microbiota in pigs and improving gut immunity.

593 • Assessment of use of xenobiotics, probiotics, minerals, vitamins and  
594 evaluation of Genetically Modified (GM) feed resources.

595 • Feed processing and resource management planning for lean periods and  
596 during natural disasters such as flood etc.

597 • Improving linkages with crop production research to improve nutritive value  
598 and mitigation of anti-nutritional factors in the pig feed components.

599 • Enhancement of nutrient utilization and bioavailability of nutrients including  
600 improving ability to digest increased dietary fibre, reduction of  
601 mineral/nutrient content in the excreta.

602

603 **Pig health management**

604 • Development of pig health management, biosecurity protocols and models for  
605 prediction of disease incidence with respect to season/climatic changes

606 • Research on existing and emerging swine pathogens including those with  
607 zoonotic importance.

608 • Linkages with National and International institutions for vaccine  
609 development against major swine pathogens.

610 • Research on non infectious diseases and immunity to improve production  
611 performance.

612 • Regulatory measure development for control of trans-boundary diseases.

613 • Awareness creation among the stakeholders to contain infectious diseases.

614

615 **Post-harvest management, product development and value addition**

616

617 Once a healthy pig attains an optimal age or body weight for slaughter, the concern is to  
618 ensure production of wholesome meat and value addition of pork. The efforts  
619 directed towards this goal will also include development and implementation of  
620 quality production parameters on par with global standards to facilitate fresh pork  
621 or product export. The pig slaughter byproduct utilization is also an area which is  
622 yet to be tapped. The major emphasis may include the complete pork production to  
623 consumption chain research for domestic and export market tapping.

624

- 625 • Development and expansion of data on quality characteristics, drug and other
- 626 residues in pork sold in India.
- 627 • Development and popularization of pig slaughter and processing facility
- 628 suited to field conditions with minimum operational costs, off-floor
- 629 operations, hygienic display and storage facilities to facilitate clean pork
- 630 production.
- 631 • Refinement and development of different value added pork products
- 632 • Development of standards and improvement of nutritive/functional value of
- 633 pork
- 634 • Reduction of post harvest losses and promote hygienic farm to fork chain
- 635 continuity through technology support and stakeholder involvement
- 636 • Technologies for improving shelf life of pork products.
- 637 • Efficient utilization of slaughter by-products for development of novel
- 638 products
- 639

640 **Human resource development and promoting piggery based**

641 **entrepreneurship**

642

643

644 The updation of knowledge and skill of researchers, field veterinarians, farm

645 personnel and most importantly farmers is expected to be a continuous process.

646 The institute will organize short and long term trainings, workshops, symposia,

647 seminars etc for improving quality of human resources. Specific steps to create

648 awareness and improve entrepreneurship will also be taken up in a systematic

649 manner. This will not only ensure employment generation, but is also expected to

650 create more and more clients for developed technologies. Therefore, emphasis will

651 be to strengthen institute -stakeholder linkage for improved pig production and

652 promotion of entrepreneurship. One of the strategies towards this goal will be the

653 creation of pig villages, production support in terms of piglet supply, good

654 management practices, providing training for production of pork products and

655 market linkages for the produce. Knowledge management and protection of

656 intellectual property will be of concern while commercializing the technologies. The

657 institute will facilitate stakeholder meeting at various stages to promote

658 entrepreneurship including the interface meetings with policy makers. Further,

659 taking advantage of advancement in information technology, the dissemination of

660 information will also be planned through mobile networks and other forms of print

661 and electronic media.

662

668

669

670

671

# Strategy and Framework

672

673

674

675 The National Research Centre on Pig will adopt the following strategies to  
676 accomplish the targets envisioned, and to enhance efficiency research, pig  
677 production, product development and promotion in the country (see annexure 1).

678

679

## 1. Achieving 30% growth rate in the piggery sector

680

681

It is envisaged that the piggery sector will be dominated by crossbred and improved variety of pigs to the level of 95% by next 35-40 years. The population of indigenous pigs will be about 5%, maintained mainly under various *in situ* conservation programmes.

682

683

684

685

### Institute's Role:

686

- Large scale application of AI technology in pig production and horizontal spread of superior germplasm
- Development of effective production package and delivery for sustaining and improving pig production.
- Further strengthening and expansion of existing public-private networks
- Development of market channels
- Development and delivery of disease forecast, early detection and control modules
- Skill upgradation programme/Human Resource Development
- Promoting climate resilient pig farming.

687

688

689

690

691

692

693

694

695

696

## 2. Achieving a minimum of 32 piglets/sow/year

697

698

- Development of suitable variety of pig
- Development of optimal package of practices including improved nutrition and health coverage for supporting increased litter number
- Physiological capacity building for improved lactation support for piglets

699

700

701

702

703

704

## 3. Conservation of indigenous pig germplasm

705

Different strains of indigenous pigs from Indian States will be collected, documented and conserved *in-situ* and *ex-situ*. Necessary steps will be taken to accord distinct breed status, wherever possible.

706

707

708

## 4. Development of technologies related to animal breeding and propagation of improved breeds of pigs

709

- Improved breeds of the pig will be propagated throughout the country for generating high income and growth among farming community.

710

711

- 712 • Development of capabilities and implementation of velogenetics
- 713 through incorporation of molecular techniques like marker assisted
- 714 introgression (MAI), marker assisted selection (MAS) and genomic
- 715 selection (GS).
- 716 • Standardization of high throughput genomic approaches such as
- 717 microarray, SNP and genotyping for improving pig breeding
- 718 programme.
- 719 • Development of breeding pyramid and herd maintenance plan for pig
- 720 farms
- 721 • Identification of new traits for improving pig production and health
- 722 • Studies on genome wide associations for various traits in pigs
- 723 • Development of capabilities for collection, maintenance of database
- 724 and analysis of large volume pedigree and performance data of pigs

725

726 **5. Developing novel feeds and technologies for high animal performance**

- 727 • Integration of already available pig feed technological options for
- 728 supporting increased production.
- 729 • Development of novel feed technologies and feed additives,
- 730 supplements and other alternatives for replacement of substances such
- 731 as growth promoting antibiotics for increased animal performance.
- 732 • Development of novel feed components for substituting naturally
- 733 grown grain and other feed resources
- 734 • Preparation of inventory of feed resources
- 735 • Biotechnological intervention for enhancing nutritive value, nutrient
- 736 assimilation and utilization of agro-industrial by-products as pig feed
- 737 • Studies on role of gut microbiome and application of metagenomics

738

739 **6. Development of early disease diagnosis, prevention and decision support**

740 **systems**

- 741 • Developing pen side disease diagnosis systems
- 742 • Region wise mapping and forecasting of pig diseases including their
- 743 impact on production
- 744 • Development of disease resistant pigs
- 745 • Development and delivery of effective marker vaccines and DIVA
- 746 tests for economically important diseases.
- 747 • Development of technologies for combating emerging swine pathogens
- 748 • Development and strengthening of bio-safety protocols for
- 749 implementation at field level
- 750 • Addressing issues related to development of antibiotic resistance and
- 751 presence of residues
- 752 • Continuing Veterinary Education (CVE) programme for skill
- 753 development and improving knowledge related to modern health
- 754 management practices for field veterinarians.
- 755 • Documentation and validation of time tested indigenous technical
- 756 knowledge (ITK) on pig disease control/treatment

- 757 • Development of strategies for the control of transboundary diseases
- 758 • Development of models for risk management and impact assessment
- 759 along the pig production chains
- 760 • Development of strong immune belt across the international borders in
- 761 collaboration with line agencies/department.
- 762 • Good emergency management practices for early detection, reporting
- 763 and counter epizootic measures.
- 764 • Development of novel technologies for improving gut and lacteal
- 765 immunity for reducing neonatal piglet mortality

#### 766 **7. Development of novel production technologies**

- 768 • Development of embryo sexing and cloning techniques for efficient
- 769 evaluation of genotypes
- 770 • Development of transgenic pig
- 771 • Application of pig as model for biomedical research
- 772 • Application of advanced technologies for pig production research
- 773 (proteomics, epigenomics etc).
- 774 • Application of nanotechnology in pig production and health
- 775 • Application of nutrigenomics for precision/personalized nutrition

#### 776 **8. Development of advanced technologies for optimising physiology and reproduction in pigs**

- 777 • Identification of mechanisms regulating porcine physiology and
- 778 reproduction
- 779 • Identification and functional/chemical characterization of
- 780 novel/candidate substances influencing physiology and reproduction
- 781 • Studies on animal adaptation and development of markers for
- 782 quantification of stress
- 783 • Refinement of technologies for cryopreservation of boar semen
- 784 • Development of techniques for detection of estrus and diagnosis of
- 785 pregnancy at field level
- 786 • Establishment of nucleus stock breeding farm and frozen semen banks
- 787 for A.I programmes
- 788 • Development of techniques and *ex-situ* conservation of valuable pig
- 789 genetic resources through cryopreservation of oocytes from genetically
- 790 superior females.

#### 791 **9. Development of post harvest management technologies**

- 792 • Technologies for minimizing post harvest losses and increasing shelf
- 793 life
- 794 • Development of HACCP/GMP protocols for pork production to
- 795 minimize post harvest losses for all producer levels
- 796 • Development of suitable standard operating procedures conforming to
- 797 international standards such as sanitary/phytosanitary/codex
- 798 alimentarius
- 799 • Refinement/development of a standard grading procedure and
- 800 grading of pork and its products at par with international standards.
- 801
- 802

- 803 • Individual postmortem animal identification and carcass labeling
- 804 • Technologies for tracing origin/source of meat/animal before and after
- 805 processing
- 806 • Development of technologies for detection and prevention of
- 807 adulteration in processed pork products.

808

809 **10. Value addition and development of novel pork products**

- 810 • Research on quality control parameters/sanitary measures and getting
- 811 the local bodies adhere to the sanitary regulations so devised.
- 812 • Pork quality assessment under different stages of processing.
- 813 • Value addition to different pork products and development of shelf
- 814 stable pork products through MAP & Retort processing
- 815 • Development of novel pork products
- 816 • Technologies for enhancement of nutritive and functional value of pork

817

818 **11. Development of broiler pig**

- 819 • Development of a crossbred line of pig strain with incorporation of genetic
- 820 components from small size pig.

821

822 **12. Promotion of pig based integrated farming system and environment**  
 823 **friendly pig farming**

824

825 In order to provide technological support to small land holders who are desirous of  
 826 practicing mixed farming for multiple livelihood options, following strategies shall  
 827 be followed to promote pig based integrated farming:

- 828 • Development of low cost pig housing systems using locally available
- 829 materials.
- 830 • Documentation and monitoring of environmental impact of pig farming
- 831 • Development of technologies for better waste management and manure
- 832 nutrient recycling
- 833 • Nutrient Management Planning (NMP) for modification of manure
- 834 composition depending upon soil chemistry

835

836 **13. Development of pig by-products and promotion of pig based**  
 837 **entrepreneurship**

- 838 • Development of novel applications/products of pig and pig byproducts
- 839 • Characterization of pig by products and development of technologies for
- 840 its utilization.
- 841 • Knowledge management and technology commercialization to promote
- 842 pig based entrepreneurship in collaboration with banking, business
- 843 houses and research institutes
- 844 • Training support for various kind of stakeholders (farmers, entrepreneurs,
- 845 personnel from line departments etc)

846

847

#### **14. Linking of Indian pig production system with global network**

848

- Development of pig village networks for transfer of technology and feed back for its refinement.

849

850

- Development and propagation of community based cooperative pig farming.

851

852

- Application of Information Communication Technology (ICT) for percolation of technologies from farm to field

853

854

- Development and support kisan call centres.

855

- Development of links with National and International organizations like ILRI, OIE etc.,

856

857

- Strengthening of collaboration and cooperation with various National departments and R&D in various countries.

858

859

860

#### **15. Development of centre of excellence in pig production**

861

- Promotion and development of NRC on Pig as a leader in pig production, product processing and research among the SAARC/SE Asian countries

862

863

864

- Making a mark of Indian pig globally in terms of research, production and product export.

National Research Centre on Pig, Guwahati, Assam is dedicated to bring in excellence in pig production, health and product processing through innovative research in order to provide technology backstopping for enhanced pork production, employment generation and poverty reduction among socially and economically weaker sections through the medium of pig husbandry.

The institute envisions developing critical innovative research in pig production, product processing, policy support and targeted technology delivery mechanisms for rapid growth of the piggery sub-sector and making India a dominant player among the pig producing nations of the world. The cutting edge research activities in various frontier areas at the Institute would be directed towards augmenting overall nutritional and economic security of pig farmer, transforming it to an organized venture for enhanced income, generate employment opportunities and act as engine for driving socio-economic progress among the citizens of the country and environmental sustainability of pig production system in the country. It is further envisioned to transform the NRC on pig to a world class institution involved in high quality, high impact research, making it a model leader institution in all areas of pig and allied research and production support with a potential game changer among the stake holders of pig farming.

The institute will remain committed to facilitate the pig rearers of the country in achieving household food, nutritional and economic security through research, extension and overall human resource development.
